Electron User's growing up!

NEXT month *Electron User* leaves the shelter of *The Micro User's* pages and starts life as a big magazine in its own right.

It's going to have all the features you've grown to expect - but lots, lots more. We promise

you a magazine packed with pages of colourful, exciting listings. Plus frank reviews of all the books, software and hardware now being produced for the Electron.

This first independent issue will see the start of two major series aimed speci-

fically at the beginner - one on Electron Basic, the other on its graphics abilities.

However, we won't be ignoring those of you who are a little more advanced.

Electron User will be covering all aspects of the micro from how it works to

how to get it working. Our experts will be revealing for you the full potential of this amazing machine.

We are determined to ensure that *Electron User* will become the next best thing to your micro - the add-on that no Electron user will want to be without.

To make sure you get the first issue - available in mid-January - place an order with your newsagent NOW.

Or better still, take out a subscription and you'll get your copy every month hot off the press. There's a subscription form on Page 31.

Runaway Success for the Electron

ALL over the country demand for the Electron is exceeding supply.

Acorn are being very tight-lipped about the number they are actually producing but it is certainly not enough to satisfy everyone who wants one.

Dealers across the country are desperate for Electrons.

"I can sell every one I can get my hands on", said one.

"I've had one delivery and it nowhere near satisfied my waiting list!"

"I haven't even got one for my nephew and

my wife's none too pleased about that".

More evidence of the phenomenal interest comes from Leeds.

When the local W.H. Smiths announced that Electrons would be on sale at their new computer shop the result was amazing.

People started queueing the night before - even camping outside the shop. As it was, not everyone was successful.

W.H. Smiths was as forthcoming as Acorn about the numbers of Electrons being produced. However their spokesperson could be drawn about the demand for the micro.

"The Electron is almost embarrassingly successful. It's awful not being able to satisfy everyone who wants one", he said.

Hopefully the situation should improve in the new year when Electrons will be available from three countries - Malaysia, Indonesia and Wales.

ALL the programs in this month's *Electron User* should work on a BBC Micro 1.2 OS with Basic II.

Combinations (Pages 6-7) will work with Basic I if you change the semi-colons in the INPUT statements to commas (or even leave them out). However, Microcosmic (Pages 8-9) won't work with Basic I.

Sideways ROM board on show

THE sideways ROM board from SIR computers was recently demonstrated at the offices of *The Micro User*.

The prototype board had room for eight sideways ROMs.

Paul Kathro, the firm's technical director, said: "Eight ROMs were chosen in order to leave room for sockets involved in our later expansions, such as a printer and RS423 ROMs".

Paul disclosed that in his investigations of the ROM system on the Electron he'd discovered that the Basic is actually split between two ROMs.

And the keyboard itself is treated as a sideways ROM.

Unfortunately, the lack of Mode 7 on the Electron restricts the number of BBC Micro

ROMs transferable to it.

At present View, Edward and HCCS Forte run successfully on the Electron.

No doubt, with the launch of SIR's board, many companies will be encouraged to adapt or create ROM-based software.

THE kaleidoscope was invented more than 150 years ago. There are several types which differ slightly in detail.

However, the essential feature of all is a basic random pattern, possibly produced by pieces of brightly coloured glass, which is reflected in mirrors to form symmetrical patterns of considerable aesthetic appeal.

Of course, once tired of one pattern, a little shake and there is another!

A common type of kaleido-

Create a colourful kaleidoscope

A fascinating and inspiring program by GWEN and ROY COLLIER

scope consisted of three similar mirrors joined at their edges so that the cross-section was an equilateral triangle.

This program given here simulates the patterns produced by this kind of instrument.

The basic patterns produced within the triangle, together with five reflections, is a hexagonally symmetrical pattern which can be viewed by selecting MODE A from the menu.

MODE B, on the other hand, shows more reflections, giving a field of view which is similar to part of a wallpaper or fabric design.

Naturally, the construction of the basic pattern relies much on the RND number function.

Line 80 replaces the black background with a randomly selected colour, while line 110 selects a colour for each of the basic pattern components, which, for simplicity, are triangles.

The vertices of each triangle are randomly generated in line 760. This produces the polar

co-ordinates of a point in the triangle shown in the diagram.

These are then transformed into cartesians in the next line.

The remainder of the PROCcalls calculates the co-ordinates of two corresponding reflected points to the right of the Y-axis.

The reflected points to the left of the Y-axis are easily obtained by simply changing the sign of each X co-ordinate.

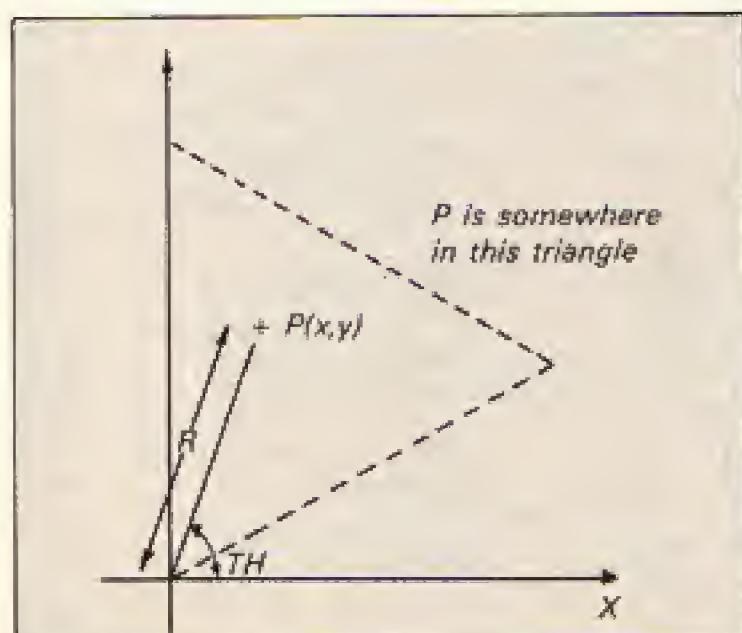

This is done in PROC-triangles when the triangles are actually drawn.

For those who like to experiment with their own modifications to programs here are a few suggestions.

After some experimentation we have deliberately eliminated black from the colour palette. If you would like to include it, you will need another suitable VDU 19 command on line 80.

Each basic pattern consists of six coloured triangles. If you would like to experiment with more or less you should change '6', the loop terminating parameter, in line 90.

It is rather annoying when the last triangle in a pattern is

COMBINATIONS is a program that turns your Electron into a puzzle machine.

It puts a secret number on the screen hidden under three question marks.

Your job is to guess the number.

Your Electron will give you hints but when — or if — you actually get the right number you'll also be told how many goes you took!

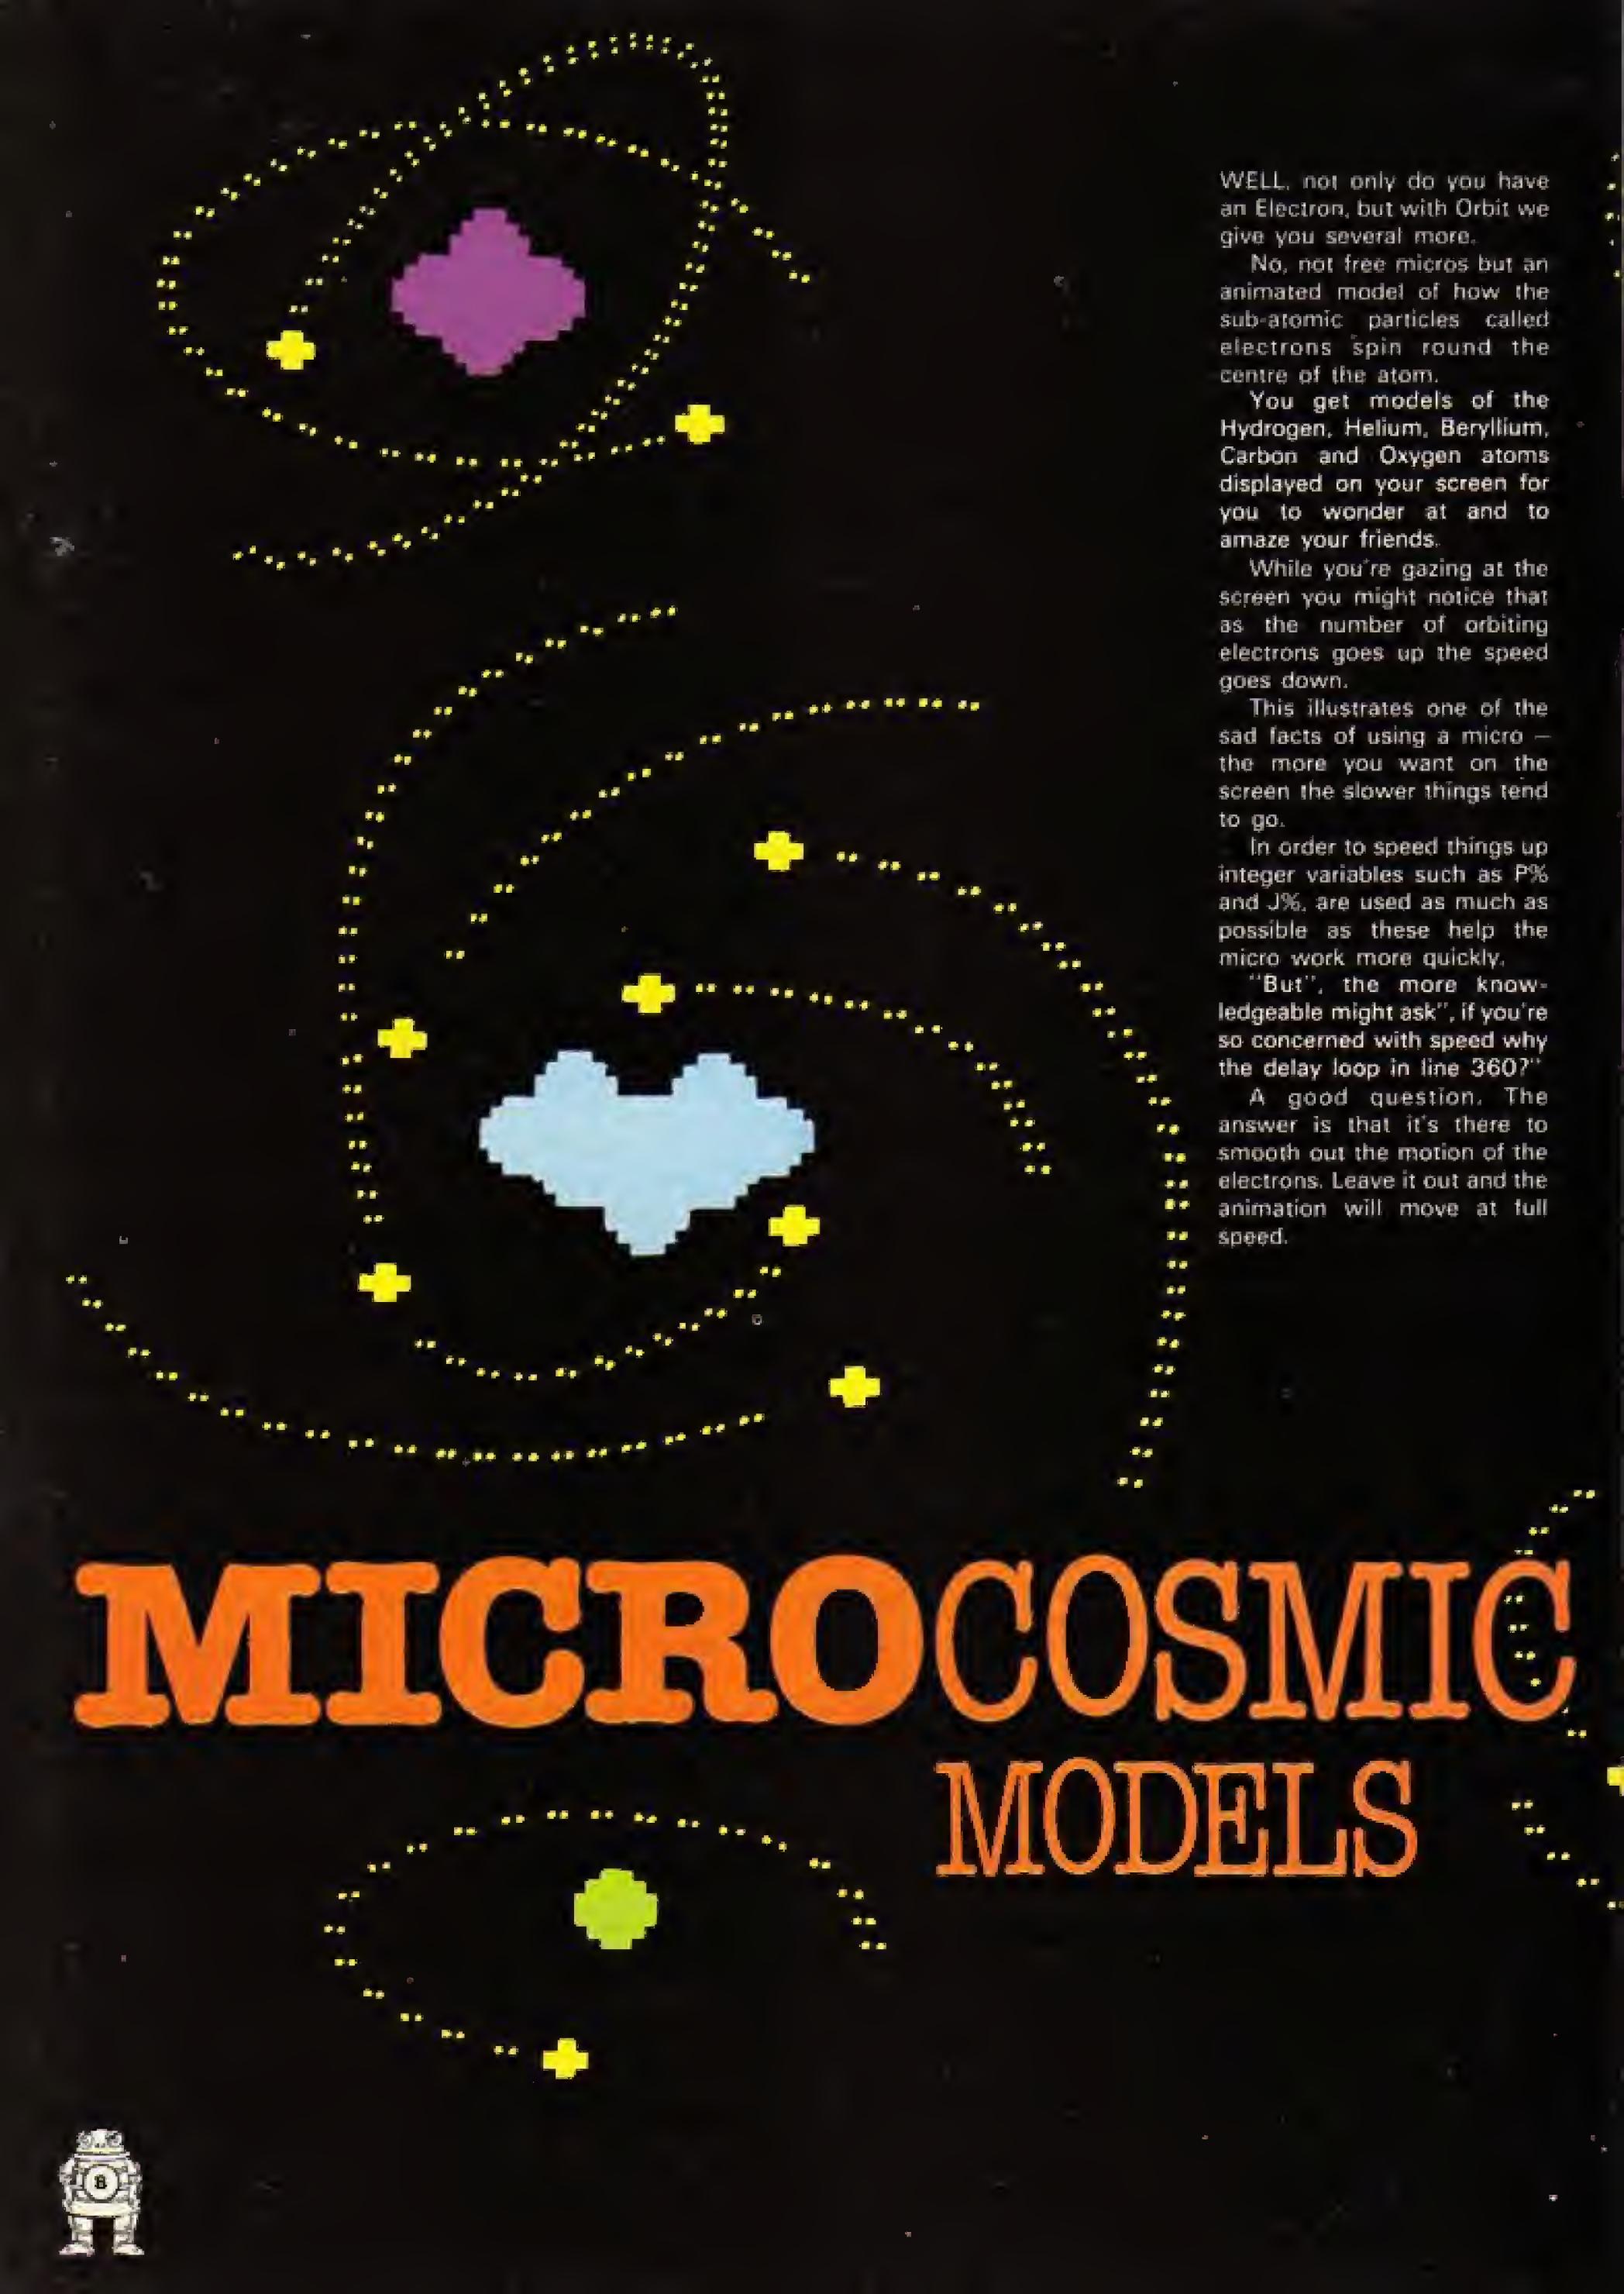

It's compulsive and fun, a game for the kids that fascinates adults.

- Can you write intelligible English?
- Can you create brilliant programs?
- Are you capable of working with a bunch of lunatics?

Yes, you've guessed – we need an editorial assistant at Micro User and Electron User!

Send your application, together with examples of your work to:

The Editor, Micro User, Europa House,
68 Chester Road, Hazel Grove, Stockport SK7 5NY.

WELL, not only do you have an Electron, but with Orbit we give you several more.

No, not free micros but an animated model of how the sub-atomic particles called electrons spin round the centre of the atom.

You get models of the Hydrogen, Helium, Beryllium, Carbon and Oxygen atoms displayed on your screen for you to wonder at and to amaze your friends.

While you're gazing at the screen you might notice that as the number of orbiting electrons goes up the speed goes down.

This illustrates one of the sad facts of using a micro — the more you want on the screen the slower things tend to go.

In order to speed things up integer variables such as P% and J%, are used as much as possible as these help the micro work more quickly.

"But", the more knowledgeable might ask, "if you're so concerned with speed why the delay loop in line 360?"

A good question. The answer is that it's there to smooth out the motion of the electrons. Leave it out and the animation will move at full speed.

**After Sunday dinner
settle down and
challenge**

SI MON

HAVE you ever played the children's game Simon Said, or its electronic reincarnation, Simon? Well here's a version of the game for your Electron.

The idea of the game is that the screen is divided into quarters.

Each of these is used to display a different colour and each colour has a different note associated with it.

The quarters then light up in a random order, though only one appears on the screen at a time.

After lighting up the various parts of the screen – with appropriate noises – the Electron then dares you to copy it.

You have to use the keyboard keys to reproduce the sequence in the right order.

At first it's easy because

there's only a few in the series, but it does get more complicated.

When it's not driving you mad it's great fun! If you make a mistake you go back to the beginning again.

While the game gets progressively harder, you'll find that using the keyboard to type in your replies is easy.

Key A corresponds to the top left of the screen, key S to the top right, key Z the bottom left and key X the bottom right.

Suppose the Electron lights up the top left of the screen, then the bottom right. To copy it you press A then X. Suppose that it then adds the top left of the screen (again)

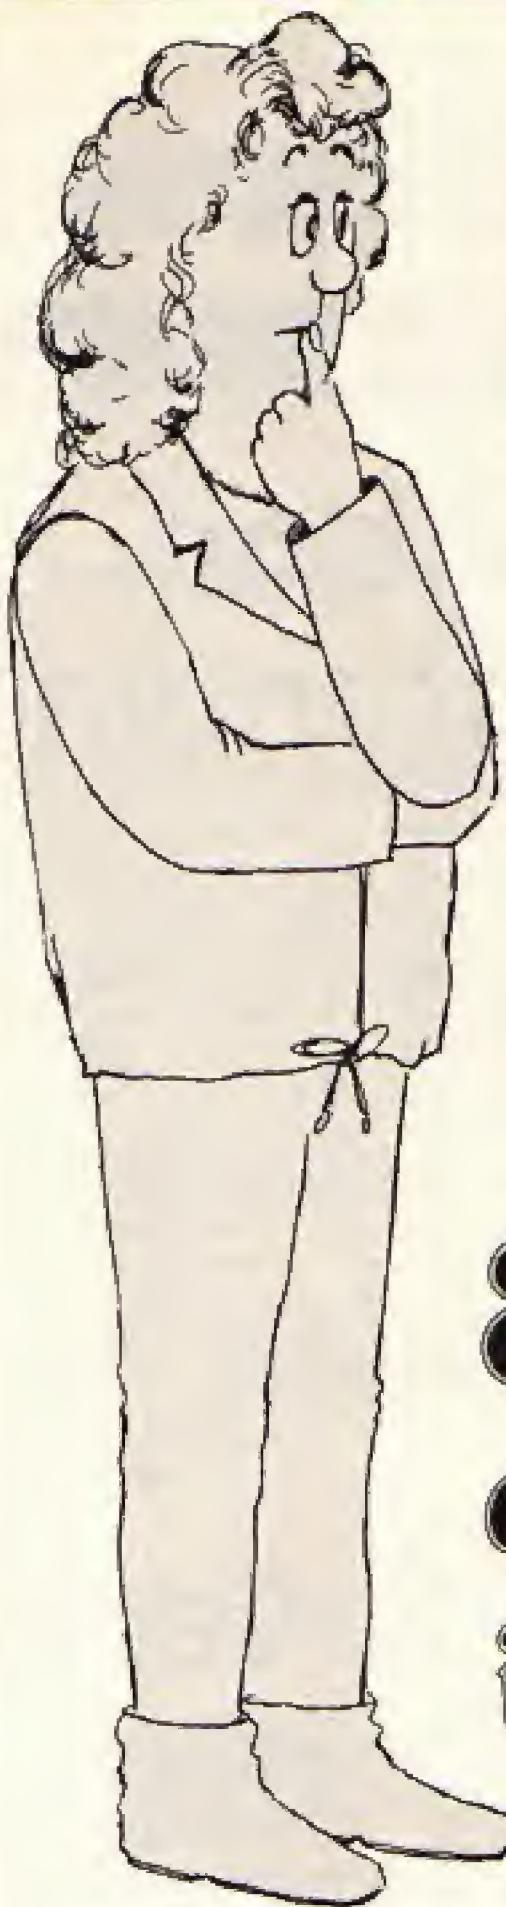

to the sequence. To copy it you must press A, X, then A again.

S will start the whole thing off, R will replay the sequence for you and E will end it.

Anyway it's much easier to play than to write about so why waste your time reading this when you could be getting on with the game?

CYLON ATTACK A&F Software

PICTURE it. You're the only interceptor pilot on board an Earth supply ship. The alarm goes. The Cylons are attacking, wave after relentless wave determined to stop you getting through.

You launch into space away from the safety of the mother ship to try and destroy as many of the enemy as you can before your shields give way or your fuel runs out.

Your eyes search the long range scanners for a glimpse of the enemy before they

This space action game is outstanding

stoop to attack, curving and weaving to avoid your defence systems.

That's the scenario for Cylon Attack, the compulsive new game from A&F Software. You play the part of the interceptor pilot, struggling to get the Cylon ships in your sights so your lasers can lock on to them.

The screen of your micro becomes the view from the cockpit. Ranged around it are the instruments. They show the state of the lasers, your fuel, your rates of turn and spin, and a long range radar scanner.

This scanner is not just decoration, but really helps you to track down and destroy

the enemy. The 3-D effect has to be seen to be believed: the aliens loom out of deep space, growing larger as they approach to attack distance.

The game is quite simply excellent, with lots more features than can be described here. The graphics leave most other games standing. And, as usual from A&F, the instructions are simple but thorough.

The only problem is that I can't find anything about it to criticise. It really is that good, and sets the standard by which action games will be judged. Thoroughly recommended.

Fun and fund-raising-fêtes for fêtes

HOROSCOPES Third Program

IF you're like me you'll realise that all horoscopes are a load of rubbish and that no one in their right mind would believe them.

This doesn't, however, stop me reading them avidly, especially when they say nice things about my star sign and promise a rosy future.

From this you'll understand that I was hooked as soon as

Horoscope came into the office.

I loaded it up all eager expectation, but sadly I was a little disappointed as I found it rather limited.

Despite the title you don't actually get a forecast of the future, just a description of your personality traits.

When you run the program it asks you for your name, date of birth and sex, and then prints out the personality profile of your star sign. All interesting stuff and good fun.

The trouble is that the profile for each star sign is the same whichever sex you are and whatever day you were born on.

This means is that there are only really 12 profiles, one for each sign. This makes it fairly limited for home use.

Having said that, the program looks ideal for fund-raising at fêtes, jumble sales and school open days. I can see it making a fortune for good causes.

Felix in action in the factory – oiling the wheels of industry

gremlins and giant mice

Felix, the hero of this game.

Your main job is to keep the generator oiled.

Easy enough, but the previous shift has left the oil cans all over the factory and you have to collect them before you can oil it and keep everything running smoothly.

This is where the work comes in.

The factory is a split level affair, the different levels being joined by ladders. Before you are able to collect the oil cans you have to negotiate a package-carrying conveyor belt.

It doesn't help that the place is infested with Gremlins and giant mice which attack you without warning or provocation.

Of course you can use the pitchfork and the bags of poison that are lying around

the place to ward them off but all this takes time and the generator is running out of oil every second.

And when you've succeeded your only reward is a still harder game!

It's not easy but it is fun, a fast game calling for quick reflexes and a sense of humour as you keep production flowing.

The instructions are clear and adequate, the controls simple and easy to use. The program's sound and graphics use the Electron's capabilities to the full.

All-in-all it's a good version of an old idea, and children love it. If you want an amusing action game for your Electron then *Felix in the Factory* is one to be considered.

BOOKSHELF

The Electron Programmer
S.M. Gee and Mike James

THE launch of a new micro always results in a rush of books about it. The choice can become quite bewildering.

This is especially so in the case of the Acorn Electron as it's so ideally suited for a first micro.

This means that a lot of the people looking for books about it will have no previous experience to help them pick a book to meet their needs.

Because of this the appearance of *The Electron Programmer* is doubly welcome.

Firstly, it's a good read about an excellent micro and secondly it's a book which I can wholeheartedly recommend for the beginner.

It starts with the usual "What is a micro and how do you set it up?" It then goes on to the inevitable PRINT and LET.

All this is pretty traditional but then the authors break the mould.

They move straight on to a discussion of looping and choice, showing how the flow of control can be affected by the Basic structures used in a program.

The chapter on procedures and functions follows on from this, then comes a brief but useful section on handling strings and numbers on the micro.

The graphics abilities of the Electron aren't ignored, nor are its sound facilities. Each aspect is well covered and illustrated with a simple game.

The book finishes with a short but well explained treatment of logic and a chapter on better programming.

The style of the book falls between that of the two you found in the box with your new Electron.

It's both more readable than the User Guide (though obviously not as comprehensive) and more adult than the

Yazdani tome.

This will make it appeal to those who find the guide a little too technical but don't want to be talked down to.

All the way through the text the principles of good programming are illustrated with short but illuminating programs.

These are easy to type in and also encourage experiment.

I must warn, however, that there are a couple of typing errors which, although easy to spot, can be a bit confusing for a while.

The authors' aim is to teach complete newcomers how to write well structured, easy to understand Basic

S.M. GEE AND MIKE JAMES

programs in a logical and coherent manner.

Happily, they don't attempt to produce a rephrased, watered-down user guide but instead concern themselves with teaching the principles of good programming on the Electron.

Basic keywords and structures are introduced as necessary to illustrate these points, each being explained simply and lucidly.

This is where the book succeeds. Reading it a beginner will not only achieve a reasonably thorough command of Electron Basic but also have gained insight into the whys and wherefores of good programming.

Well worth considering.

THIS month's Casting Agency features a whole Noah's Arkful of creatures devised by the girls of class 4S, Inglewood Junior School, Carlisle. So thanks from *Electron User* to Caroline, Margaret, Morven, Wendy, Tracy and Helen. (And a special thanks to Dawn whose shape didn't quite scrape in.)

At *Electron User* we're having fierce arguments about Fido and Rover. We know one of them is pedigree - we just can't agree which!

QUIACKERS!

**JOHN HARPER suggests a way
to get your characters moving**

HAVE you ever wondered how to make the characters from Casting Agency come alive?

Well, Quackers shows you one way of doing it.

The Electron User duck waddles across the screen by selective use of cleverly defined characters.

The listing uses lots of REM statements to explain how the program works.

Remember, you don't have to type the REMs in. They are there to help you—but your Electron ignores them.

Compile your own Buzz Word Generator

Inscrutable vectoriser Mike Cook obfuscates excessive integers

HOW many times have you searched for that certain phrase that will impress your boss? Maybe you are thinking of becoming a technocrat. Or perhaps you are trying to write an impressive advertisement.

Not to worry, help is at hand in the form of The Electron User Buzz-Word Generator.

With this you can produce phrase after phrase of impressive-sounding technical jargon.

The only snag is it might not mean all that much. But that doesn't seem to put off many people, so why should you bother?

The program works by gathering words from three groups of data statements into an array. This is done in lines 10-100.

These are placed into the two-dimensional string variable WORD\$. The first two groups consist of adjectives and the third of nouns.

A note of how many words are in each group is kept in the array called MAX.

This structure is used to allow you to add your own words without the need to alter any of the program.

Lines 110-210 generate the phrase from the buzz words by picking a random word out of each group.

Line 160 prints out a single word from one of the groups and, as it is in a FOR/NEXT loop, it will do this for each of them.

The words used to form the phrases are held in data statements in lines 220-340.

Each group finishes with a DATA statement containing a null string. These are lines 250, 290 and 340.

A null string is a string with nothing in it, as indicated by

the two quotation marks being next to each other (note no space).

This is the same as the string in line 80. If a space is typed here then the program will not work properly.

To add your own words, just insert extra lines with DATA statements containing your new words.

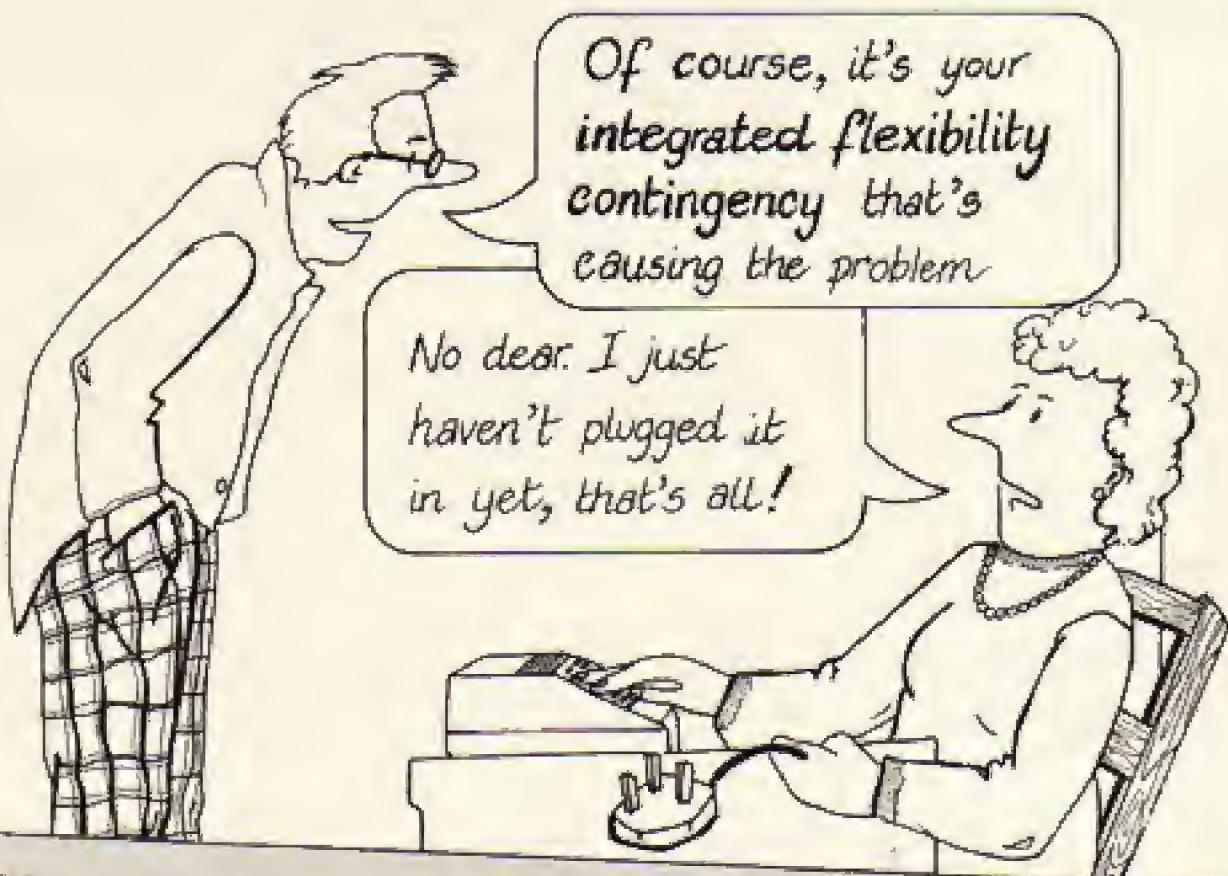

For example, if you want to add more nouns (third group) add your extra lines between

lines 300 and 340.

If you run out of line numbers you can always renumber the program with the RENUMBER command.

You will find many a good phrase generated. One that I like a lot is: "Synchronised reciprocal concept." It sounds great, even though I haven't a clue what it means.

But, as I said, since when did that stop anybody using a phrase?

Make it fair and **SQUARE**

SHOW your mastery of the keyboard with this program which draws squares of varying size and colour. Amaze your friends with your graphical dexterity!

The program produces a series of squares on the screen. You decide where they go, what size they are and how fast you can

move them around.

The keys I, J, L and M are used to manoeuvre the squares, S to shrink them and E to enlarge them.

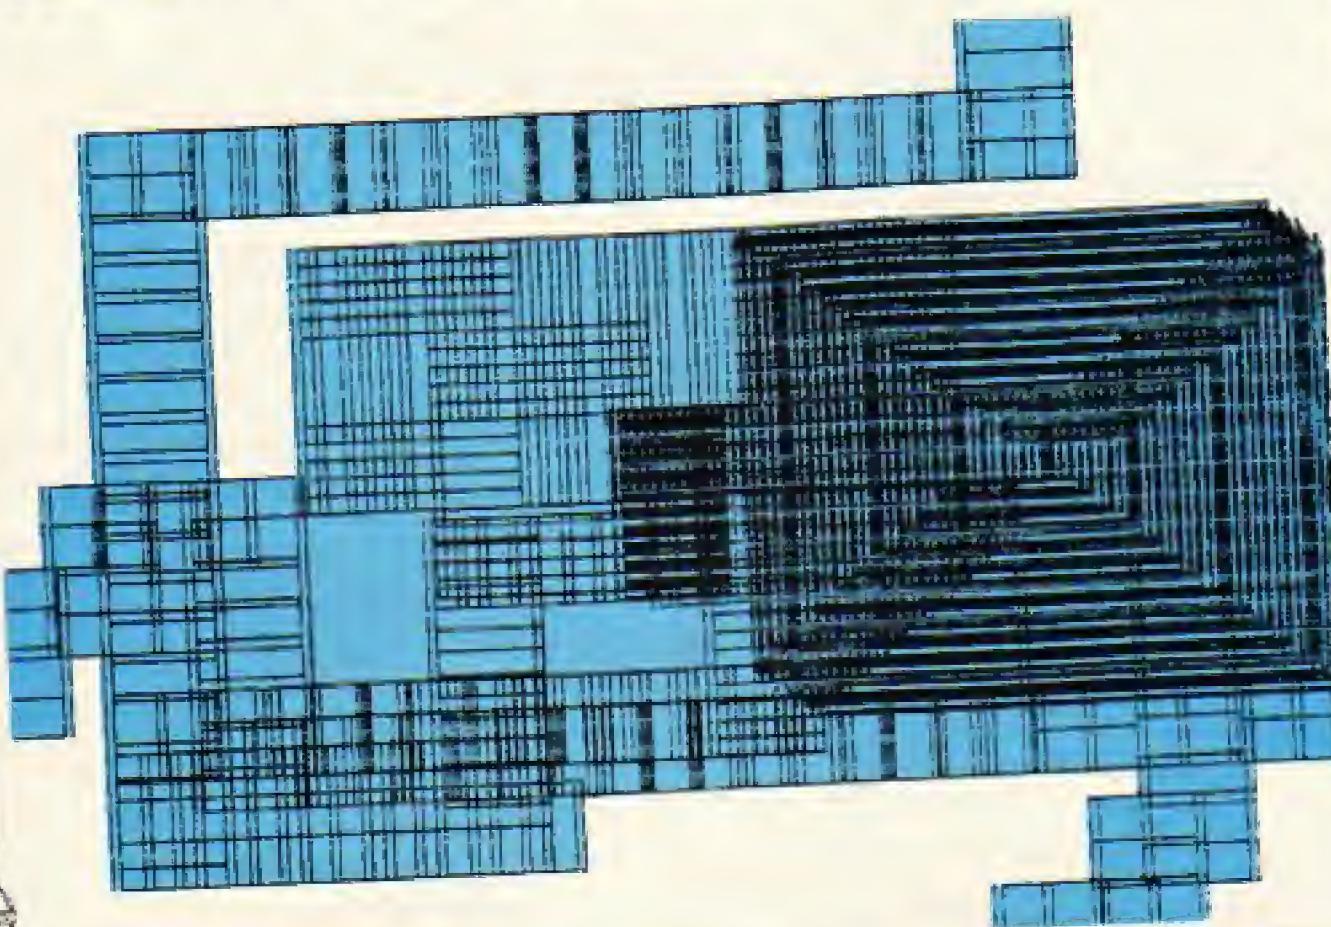

The < and > keys decrease and increase the speed of movement of the squares.

When you want to clear the screen and start

again just press the Space bar. And if you ever have enough then press the Break key.

You would also be advised to press the key marked f0 as line 60 of the listing changes the response of your keyboard.

Pressing the f0 key sets things back to rights.

AS you might guess, Iron Ring uses your Electron's graphics to depict a ring on the screen. As it's in Mode 0 you get no colour but what you do get is a marvellous three dimensional effect.

Despite the fact that it appears solid it is actually just a circular series of ellipses drawn over each other, each one slightly offset.

ON ELECTRON!**

Try this geographical quiz from NORMAN PARR. It also offers techniques you can incorporate into your own programs.

THIS program draws a map of Europe and then sets up a test situation. It illustrates the use of MOVE and PLOT commands, the drawing of text windows and printing at the graphics cursor.

The majority of the program is taken up by data statements.

These largely contain the X and Y co-ordinates needed to draw the map.

The Electron has a screen divided into 1280 X and 1024 Y co-ordinates and it is necessary to locate each mapping point within these parameters.

If you want to draw a map the first thing to do is to select a map with a suitable scale.

This one was first traced out of an atlas and then a grid, drawn on tracing paper, was placed over it.

Each grid line has to be numbered and it is these numbers that provide the co-ordinates.

In this case the grid was numbered 0 to 220 on the X axis and 40 to 230 on the Y axis.

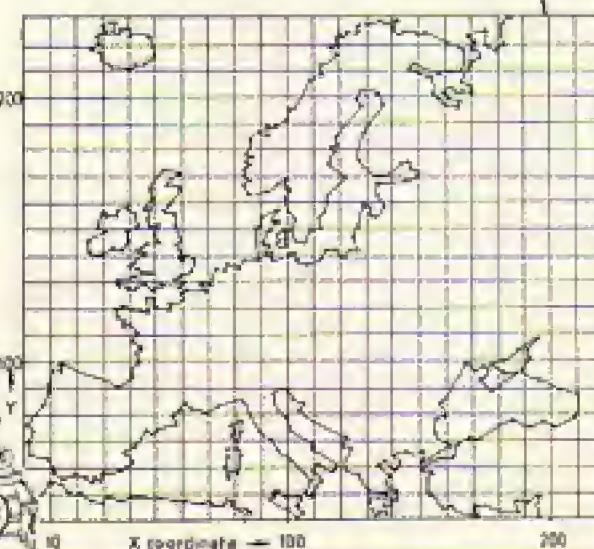

It is not necessary to plot an excessive number of points but the basic shape of the area must not be lost.

The points used in this program and the grid lines are shown on the now simplified map of Europe. In all there are 441 co-ordinates.

The next step is to set up two arrays to carry the co-ordinates. These are X% and Y% and each is dimensioned at the start of the program.

The data statements are then read into the arrays and at the same time each is multiplied by 4.

The co-ordinates could

EUROMAP

have been read from the map as the final numbers, but this would have made an already tedious task even more difficult.

The map extremities are now 880 and 920 respectively.

It is then straightforward to use MOVE and PLOT 5 (DRAW) to produce the map.

The only problem is that the map is not a continuous line. Each part of the program is separated into sections, with a MOVE statement shifting the cursor to its new starting point each time. REM statements indicate the appropriate sections.

The rest of the program uses the map to develop a test

based on seas. The variable NAMES is used to hold the names of the water areas.

These are READ out of data at the end of the program. TESTX and TESTY carry the co-ordinates for plotting an asterisk marking the area on the map under examination.

VDU28 is used to set up a text window in which the questions are asked. This area is coloured white with COLOUR 129:CLS in line 500.

As each question is asked the appropriate question number and an asterisk appear on the map.

This is done by using VDU5 which separates the text and graphics cursors, allowing printing to be done at the graphics cursor.

VDU4 must be used

immediately afterwards to rejoin the cursors to write inside the text window. A question mark appears on the screen (line 620) prompting an answer.

ANSWERS is then compared with the relevant NAMES. A simple variable RIGHT counts the success rate.

At the end of the test a score is given and the correct answers are printed on the map to check errors.

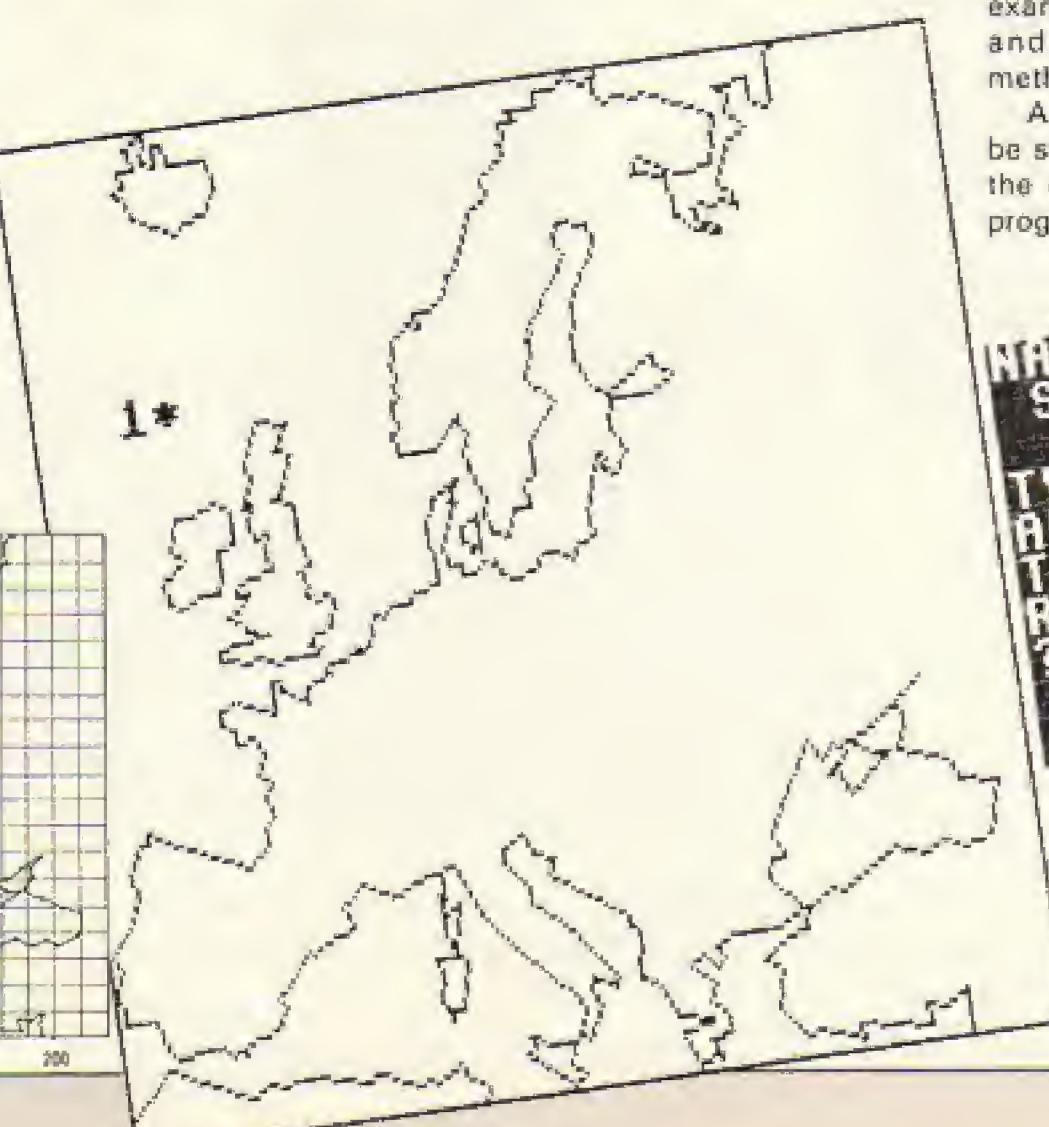

This printing is again done using VDU5 and 4. Note the extra 60 put on the X co-ordinate to move the name to the right of the asterisk to prevent over-plotting.

This particular test is obviously very short and only serves to illustrate a technique.

It would be possible to test other aspects of Europe, for example capitals, countries and rivers using similar methods.

A series of such tests could be stored on tape or disc and the chosen test fed in under program control.

This listing is included in this month's Micro User cassette tape offer. See order form on Page 97 of The Micro User.

The end of the beginning!

Next month *Electron User* becomes a completely separate magazine. And this means you get . . .

- Lots more packed and colourful pages devoted solely to the Electron.
- Lots of listings of games, utilities, graphics, education – in fact the whole range of Electron computing.
- Lots of easy to follow features on everything to do with the Electron. Beginner or expert you'll find something fascinating within its pages.

PLUS

- Expert reviews of all the new books, software and hardware – if it's for the Electron you'll find all the facts you need in *Electron User*.

The most exciting computer magazine yet.

If you've got an Electron – or about to get one – let *Electron User* show you how to make the most of it.

SPECIAL OFFER!

Free cassette of 26 Electron programs if you order NOW!

Valid to 31/1/84.

Please send me the next 12 issues of *Electron User* at the special introductory offer inclusive price of £12.
